

Problem Statement

On the eve of [Diwali](#), Hari is decorating his house with a serial light bulb set. The serial light bulb set has N bulbs placed sequentially on a string which is programmed to change patterns every second. If atleast one bulb in the set is on at any given instant of time, how many different patterns of light can the serial light bulb set produce?

Note: Lighting two bulbs $*-*$ is different from $**$ -

Input Format

The first line contains the number of test cases T , T lines follow.

Each line contains an integer N , the number of bulbs in the serial light bulb set.

Output Format

Print the total number of patterns modulo 10^5

Constraints

$1 \leq T \leq 1000$

$0 < N < 10^4$

Sample Input

```
2
1
2
```

Sample Output

```
1
3
```

Explanation

Case 1: 1 bulb can be lit in only 1 way.

Case 2: 2 bulbs can be lit in $-*$, $*-$, $**$ i.e. 3 ways.
